

Jenkins Master slave Configurations

PROJECT-4

Presented By

Pravalika Amgoth

Workflow Overview

Method-1

1. Installation of Nginx

2. Installation of HTTPD

3. Installation of Sonarqube

4. Installation of Tomcat

5. Static application deployment

Method-2

1. python application deployment-manual method

2. Using Bash script

3. Using Terraform

4. Java application deployment-manual method

5. Using Bashscript

What is Jenkins master-slave configuration

The Jenkins Master acts as the central server that manages the build pipelines, schedules jobs, and coordinates tasks. The Slaves (agents) are distributed nodes that execute the tasks assigned by the master, enabling parallelism and reducing load on the master.

- Master schedules and monitors builds.
- Slaves handle heavy workloads by running jobs, allowing scalability and efficient resource utilization.

Method-1

1.Nginx Installation

Step 1: Launch Master and Slave Instances

Step 2: Install Jenkins on Master

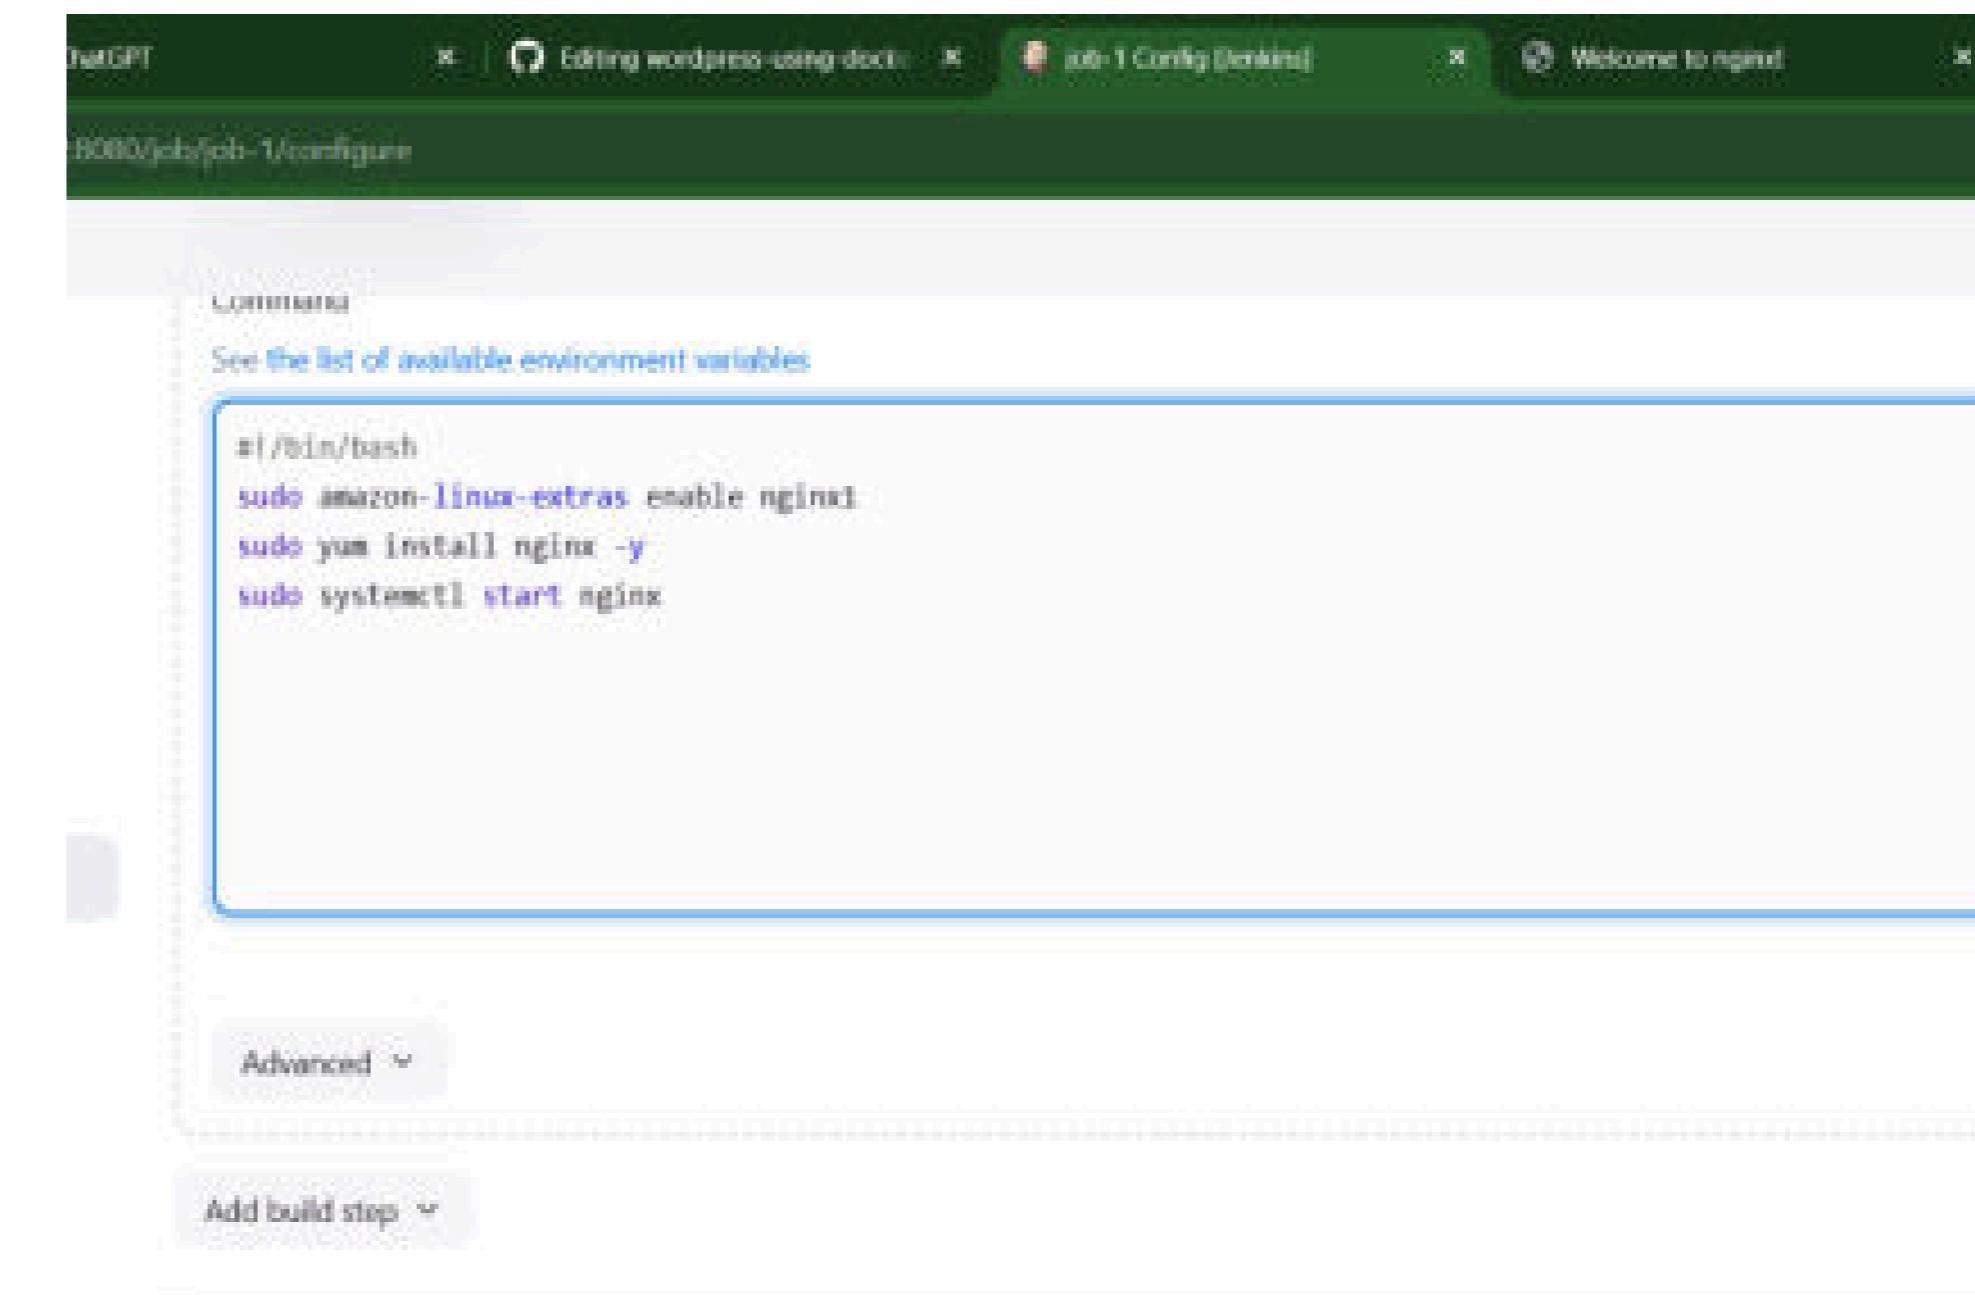

Step 3: Configure Jenkins and Add Nodes

Step 4: Create a Job in Jenkins

Step 5: Configure Shell Commands to Install Nginx

Step 6: Run the Job

Step 7: Access Nginx on the Slave Instance

2. HTTPD Installation

Step 1: Launch Master and Slave Instances

Step 2: Install Jenkins on Master

Step 3: Configure Jenkins and Add Nodes

Step 4: Create a Job in Jenkins

**Step 5: Configure Shell Commands to Install
HTTPD**

Step 6: Run the Job

Step 7: Access HTTPD on the Slave Instance

The screenshot shows a Jenkins job configuration page titled "job-2 httpd Config (jenkins)". The page displays a series of shell commands intended for installing and starting the Apache HTTP Server (HTTPD) on a Linux system. The commands are:

```
#!/bin/bash
sudo yum update -y
sudo yum install httpd -y
sudo systemctl start httpd
sudo systemctl enable httpd
```

Below the command block, there are sections for "Advanced" settings and "Post-build Actions".

3.Sonarqube Installation

Step 1: Launch Master and Slave Instances-t2.medium

Step 2: Install Jenkins on Master Instance

Step 3: Configure Jenkins and Add Slave Node

Step 4: Create a Jenkins Job

Step 5: Configure Shell Commands to Install sonarqube

**Step 6: Access SonarQube on Slave
Instance:http://<Slave_IP>:9000**

```
wget https://binaries.sonarsource.com/Distribution/sonarqube/sonarqube-8.9.6.50800.zip
unzip sonarqube-8.9.6.50800.zip
mv sonarqube-8.9.6.50800 sonar
cd sonar/bin/linux-x86-64
chmod +x sonar.sh
sh sonar.sh start
tail -f /home/ec2-user/workspace/slave3-job/sonar/logs/sonar.20250107.log
```

4.Tomcat Installation

Step 1: Launch Master and Slave Instances

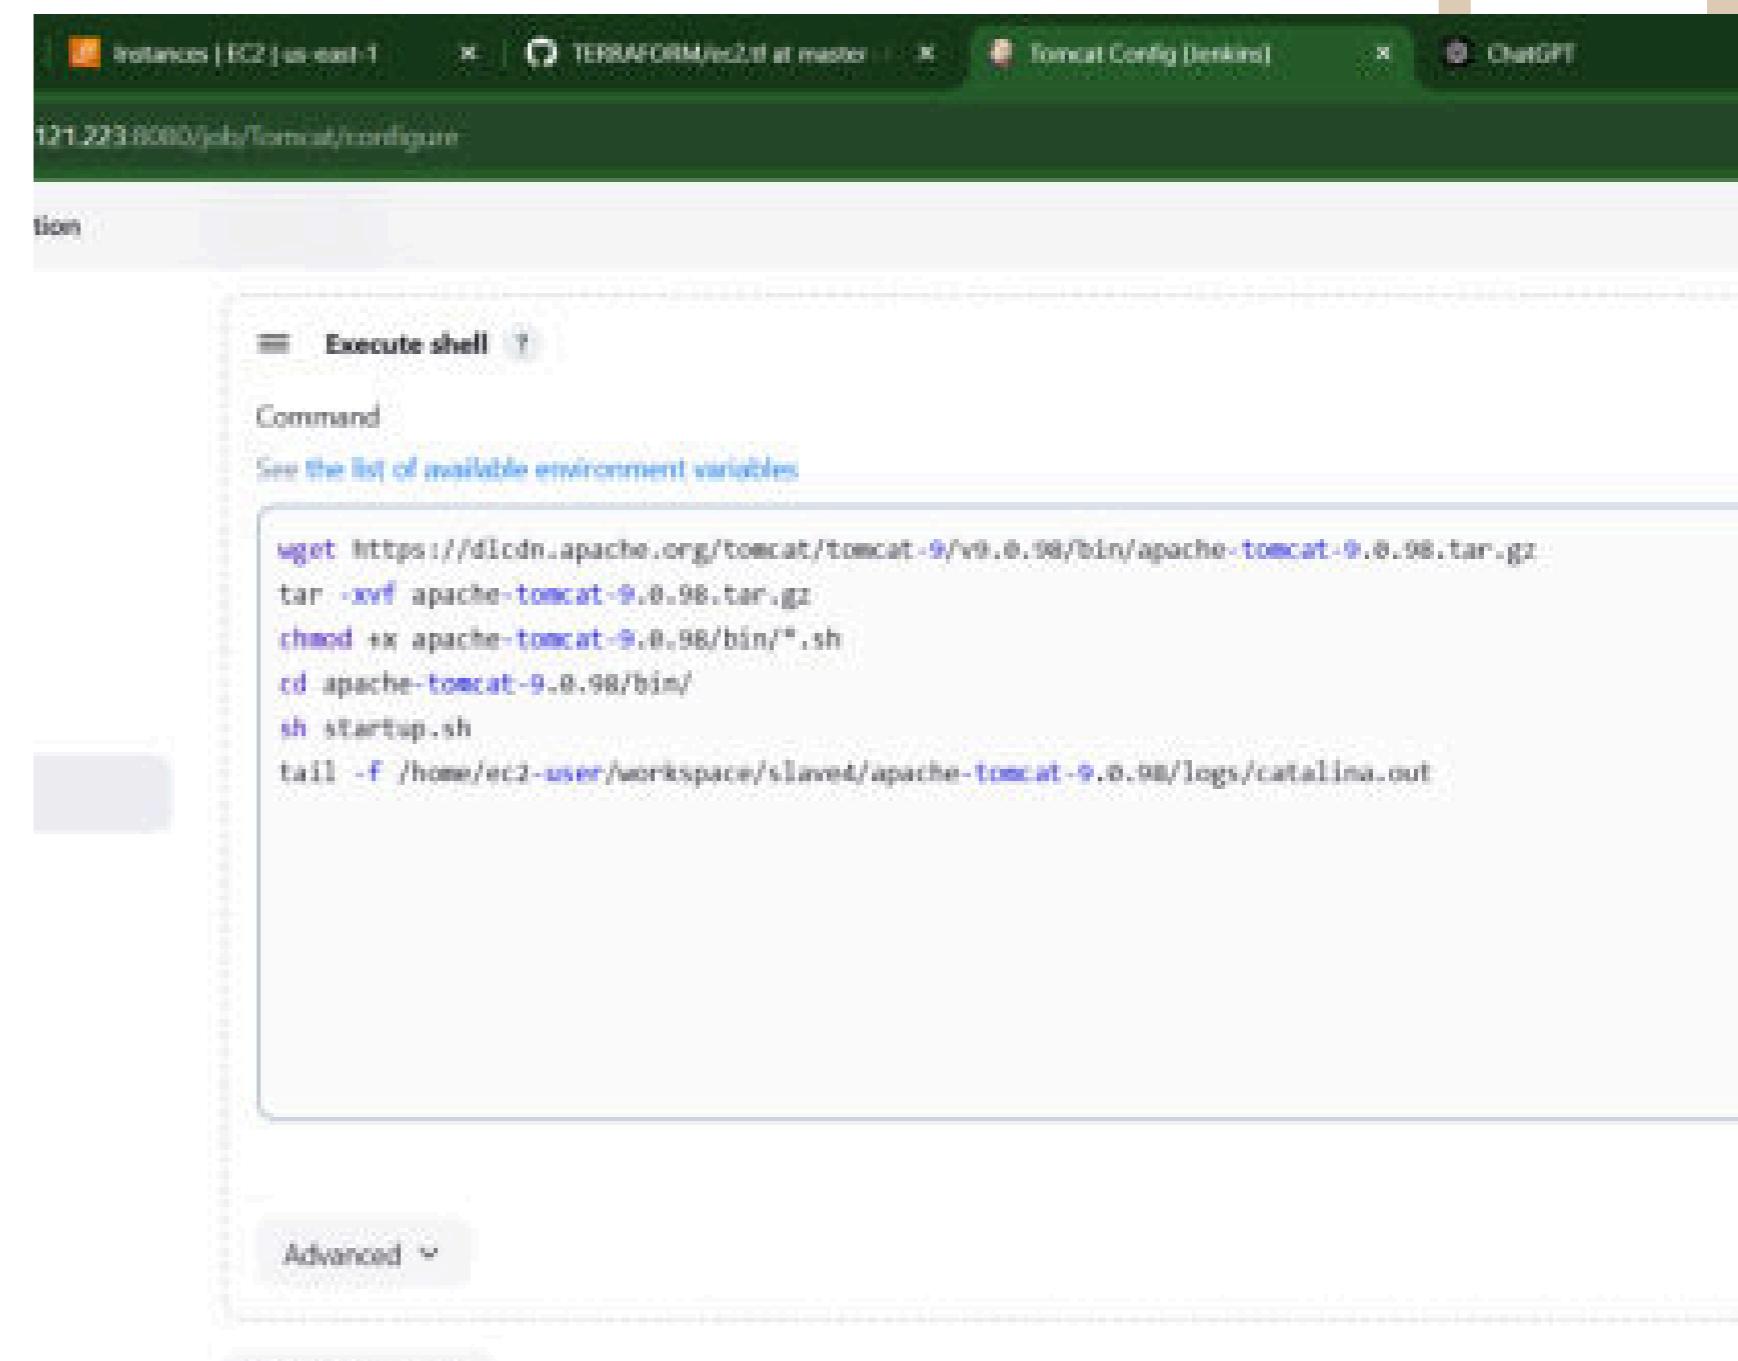

Step 2: Install Jenkins on Master Instance

Step 3: Configure Jenkins and Add Slave Node

Step 4: Create a Jenkins Job

Step 5: Configure Shell Commands to Install tomcat

Step 6: Access tomcat on Slave Instance:<http://:8080>

The screenshot shows a Jenkins pipeline configuration. At the top, there are three tabs: 'Instances | EC2 (as ec2-1)', 'TERRAFORM/ec2-1 at master', and 'Tomcat Config (jenkins)'. The main area is titled '121.223.80.80/jenkins/configure' and contains a section for 'Execute shell'. The 'Command' field contains the following shell script:

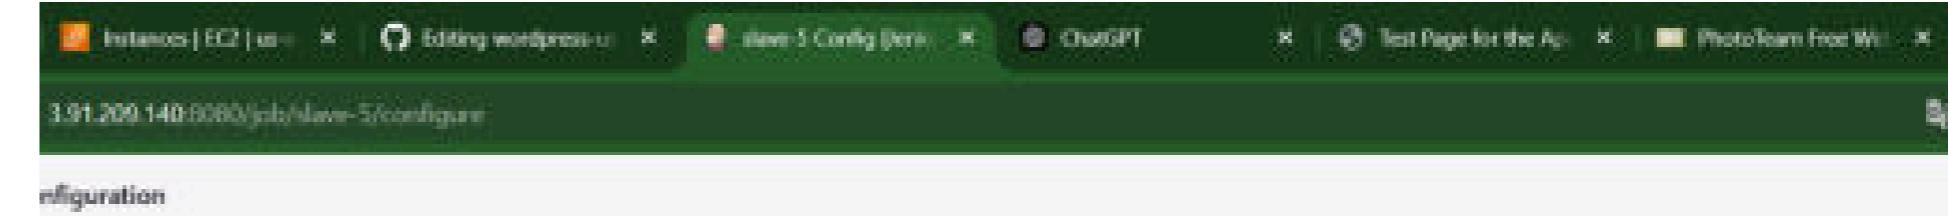

```
wget https://dlcdn.apache.org/tomcat/tomcat-9/v9.0.98/bin/apache-tomcat-9.0.98.tar.gz  
tar -xvf apache-tomcat-9.0.98.tar.gz  
chmod +x apache-tomcat-9.0.98/bin/*.sh  
cd apache-tomcat-9.0.98/bin/  
sh startup.sh  
tail -f /home/ec2-user/workspace/slaved/apache-tomcat-9.0.98/logs/catalina.out
```

Below the command field is an 'Advanced' dropdown menu.

5.Static Application Deployment

Step 1: Launch Master and Slave Instances

Step 2: Install Jenkins on Master Instance

Step 3: Configure Jenkins and Add Slave Node

Step 4: Create a Jenkins Job

Step 5: take any static website from free css templates

Step 6: Configure Shell Commands to Install sonarqube

step 7:access the static application by using slave public ip address

Method-2

1.Python web application -manual process

Step 1: Launch Master and Slave Instances

step 2:Install jenkins in master and python3-pip in both master and slave

step 3:Setup jenkins and add the slavenode

step 4:Create a jenkins job

step 5:Place the github url which consist of the python application code

step 6: In execute shell :pip3 install –r requirements.txt,python app.py

step 7:Access the application using slave public ip:and the node port which is present in the code

Using Bash Script

Step 1: Launch Master and Slave Instances

Step 2: Install Jenkins on Master Instance

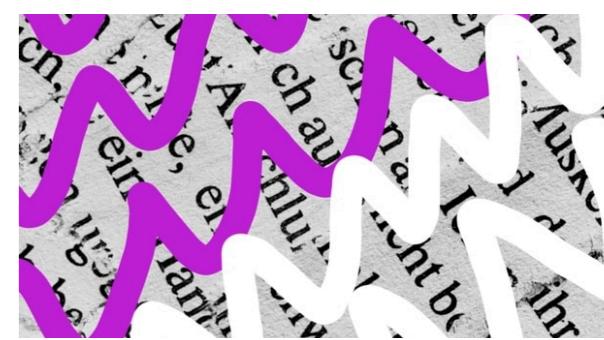

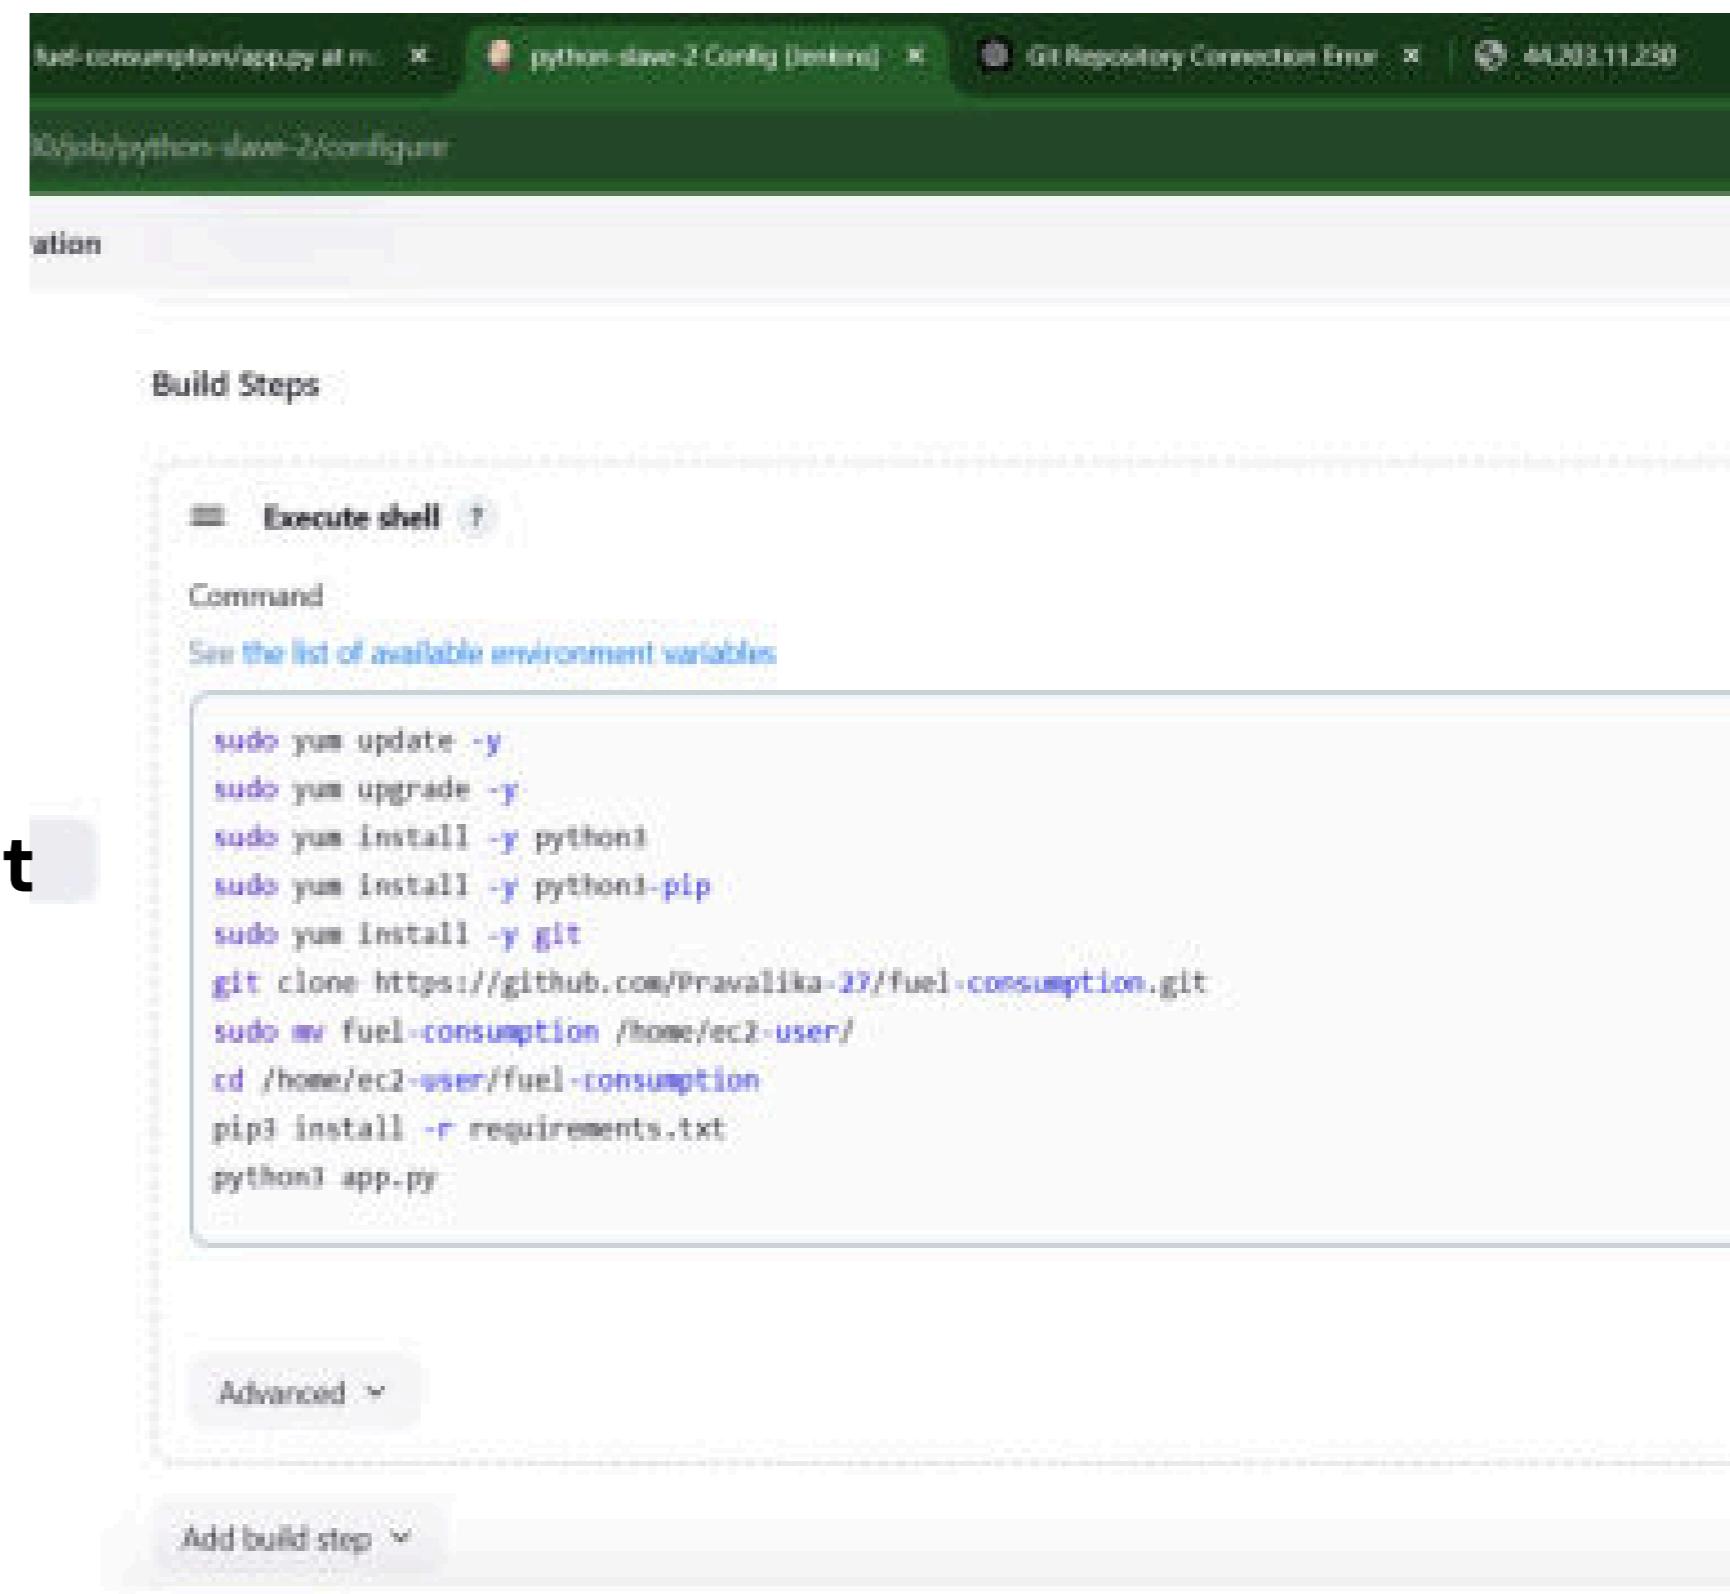

Step 3: Configure Jenkins and Add Slave Node

Step 4: Create a Jenkins Job

Step 5: Configure Shell Commands :add python,git installation and clone the repository

step 6:Build the job

step 7: Access the application using slave ip and the node port

Using Terraform

step 1:launch master and slave instance

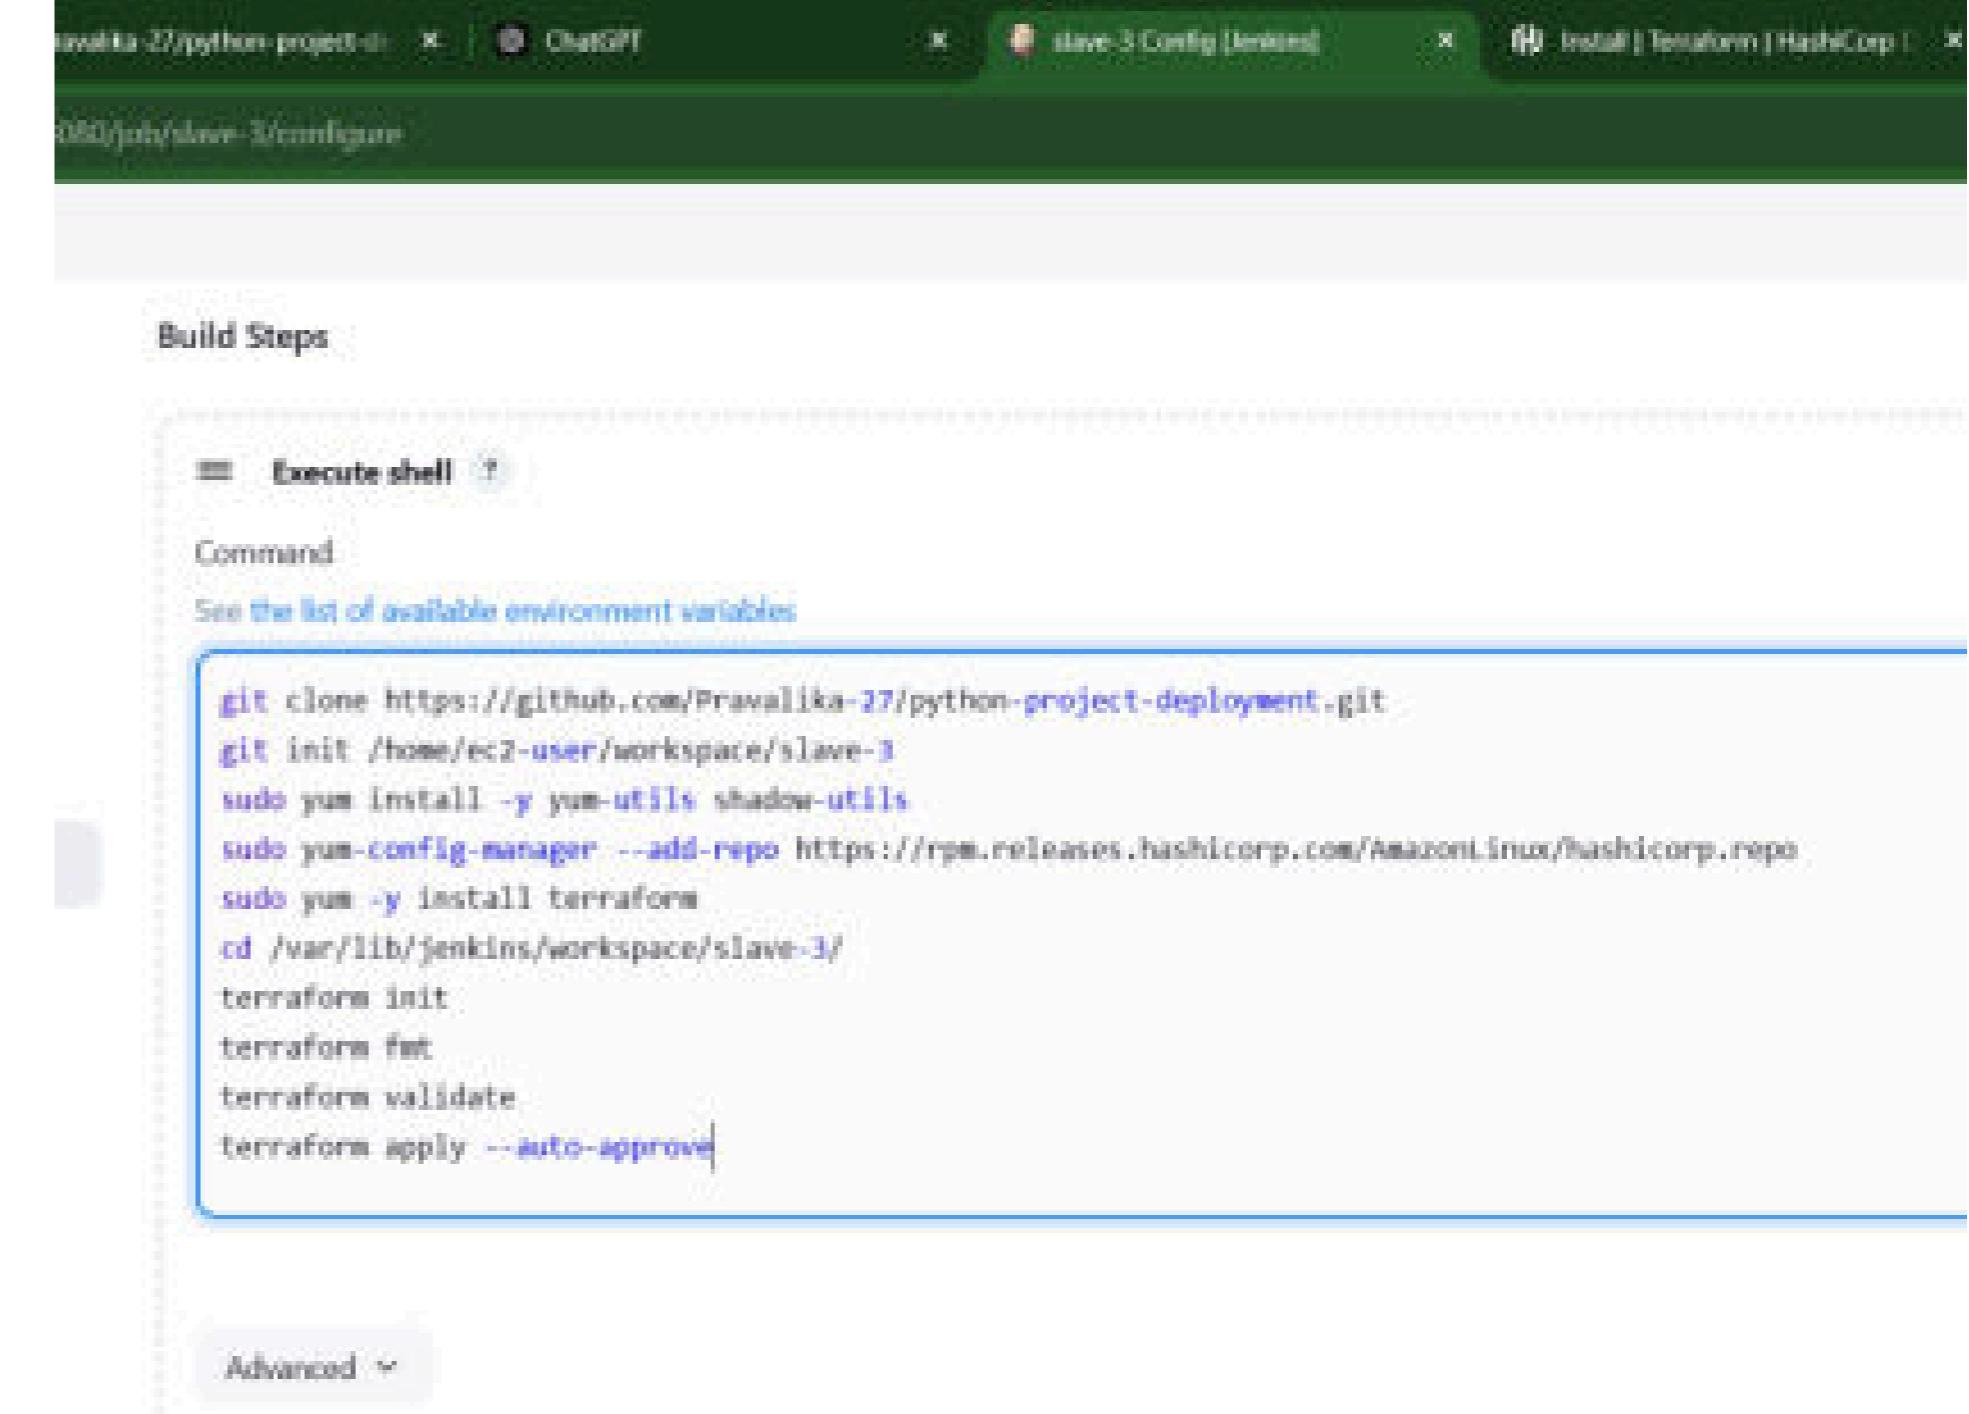

step 2:set up jenkins and add node

step 3:install aws credential plugin and add the credentials

step 4:create a job

step 5: add script in execute shell ,I have cloned the repository which consist of the python code

step 6:Build the job and access the application by using newly created instance public ip

The screenshot shows a Jenkins job configuration page. In the 'Build Steps' section, there is a single 'Execute shell' step. The 'Command' field contains the following Terraform commands:

```
git clone https://github.com/Prawalika-27/python-project-deployment.git
git init /home/ec2-user/workspace/slave-3
sudo yum install -y yum-utils shadow-utils
sudo yum-config-manager --add-repo https://rpm.releases.hashicorp.com/AmazonLinux/hashicorp.repo
sudo yum -y install terraform
cd /var/lib/jenkins/workspace/slave-3/
terraform init
terraform fmt
terraform validate
terraform apply --auto-approve
```

Java application deployment

step 1:launch master and slave instance

step 2:Install maven and jenkins in master,tomcat in slave server

step 3: install deploy to the container plugin

step 4: create a job and add the git url which consist of java application

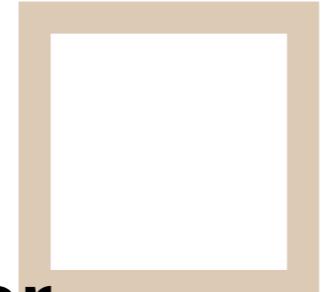

step 5:near build steps -->Goals:add clean package

step 6: post build actions:select deploy war/ear to the container-->give file path and context path-->select containers-->tomcat 9x remote-->add tomcat url and credentials

step 7:Build the job then we can see the application in the tomcat page their we can access the application

Using Bash Script

step 1:launch master and slave instance

Step 2: Install Jenkins and tomcat in slave server

Step 3: Configure Jenkins and Add Slave Node

Step 4: Configure the execute shell

The screenshot shows the Jenkins job configuration interface. Under the 'Post-build Actions' section, there are three checkboxes: 'Inspect build log for published build scans', 'Terminate a build if it's stuck', and 'With Ant'. Below this is the 'Build Steps' section, which contains an 'Execute shell' step. The 'Command' field is expanded, showing the following Jenkinsfile code:

```
sudo yum install git -y  
git clone https://github.com/Prawalika-27/box-fuse-war.git  
sudo yum install maven -y  
cd box-fuse-war  
mvn clean package
```

step 5: post build actions:select deploy war/ear to the container-->give file path and context path-->select containers-->tomcat 9x remote-->add tomcat url and credentials

step 6:build the job the application can be seen in the tomcat page

thanks
you
